Abstract In recent years, the participation of citizens in public life plays an increasingly important role in the management, in particular in local government units at the local level. Changes in the needs and demands of citizens have led to the fact that social participation has effectively transformed itself into active, effective and multidirectional action. Local communities are becoming more aware of the fact that their active participation in public life, based on multilevel and multi-sectoral cooperation, depends on the quality of public services. The purpose of this paper is to show opportunities and different solutions of influence citizens on the shaping of public services in selected local governments units on the same level in Italy (Piacenza) and Poland (poviats in Małopolska).

Introduction

Nowadays, rapidly progressive socio-economic development caused that changed the expectations of citizens to services provided by the public services. In countries where democratic systems exist, there are numerous legal regulations and a broad set of instruments to oversee the proper performance of public authority tasks at various levels of activity. This control, which is a part of public management is institutionalized in the vast majority of cases
and in recent years the need for social control has become more and more evident. The implementation of this control is possible, inter alia, through the use of tools ensuring effective cooperation between citizens and the public authorities. While direct co-operation between the public and central government is limited, it is possible and desirable at the local government level. Citizens should participate in the decision-making process, and the requirement for effective management in local self-government units is, firstly, equipping local communities with actual and authentic entitlements, and secondly, realizing their enormous role and impact.

It is therefore appropriate to check and demonstrate how local communities in Italy and Poland participate in the shaping of public services to which the local authorities are obliged in both countries. In the paper tried to show the different role of citizens in shaping local politics and analyzed the strategic planning process in Piacenza and Małopolska, where were taking into account the strategies for solving social problems, because the activity of local authorities in the social sphere, focused on problem solving, it includes the provision of certain services.

In the article there were used various methods and techniques of research. Inter alia there used the descriptive, comparative and tabular – descriptive method. There were analyzed documents and data in territorial self-government units and statistical data published by national institutions.

The article is the result of international pilot studies conducted jointly by universities Università Cattolica del Sacro Cuore and Jagiellonian University.

**International determinants of public participation**

The essence of participation in public affairs management is that public administrations, both governmental and local government, interact with the citizens through the use of specific participatory and consultative procedures (Hausner, 2008). The introduction of participation there are in favor of both ideological considerations (a reference to the democratic ideas) and practical considerations (increase effectiveness, improvement and adaptation of services) (see Ober, 2017). The key element of such governance is public participation, which has been recommended internationally at the international level (OECD, European Commission) since the 1990s. This participation includes four main forms of public participation in public life:

- public activity (actions initiated by local community members in the form of lobbing, protest, advocacy, civil disobedience),
- involvement of citizens (actions initiated by public authorities – for example in the form of public consultations);
- electoral participation (activities involving participation in elections and referendums), and
- compulsory participation (compulsory actions – for example paying taxes to a given community) (Kaźmierczak, 2011).

In Poland, from the point of view of influence on the current activities of the territorial unit and the provision of its public services, a key role plays engaging of citizens and electoral participation. In Italy only electoral participation contributes to shaping services at the local level, and citizens rather are not interested in directly influencing the shaping of local strategy documents.

It is worth emphasizing that the involvement of citizens in public life in specific countries depends on a number of issues, including: cultural nature (the willingness of the society to co-manage), economic (specific financial resources), political (openness to cooperation with citizens and acceptance of certain forms of cooperation with Authority side) and technical (established rules and procedures) (Zybała, 2013).
Citizen participation in shaping public services in poviats of Małopolska

There are many forms of direct or indirect participation in the Polish legal system, including information; consultation, including participatory budget institutions or civic initiative adopt resolution; delegation; cooperation, local initiative, and of course the general elections and local referendums (see Dobrowolski, Koźuch, Pyplacz, Sasak, Szczudlińska-Kanoś, Žukovskis, 2016). It should be emphasized that the selection of the above mentioned solutions, even despite the lack of regulatory work in the part of local governments on the basis of statutes, regulations, or various other regulations, agreements and their practical use is characterized by great diversity.

Talking about citizen involvement in public management, it is important to address to the issue of local strategy documents, which are increasingly influenced by the opinions of local community members. In Poland, one of the strategic documents that is compulsory at the local level is a strategy for solving social problems. Mandatory creation of this type of strategy has been imposed by the legislature and results in the implementation of a number of legal acts, which should include in particular the Act of 12 March 2004 on social assistance (see Szczudlińska-Kanoś, 2015).

For the purposes of this article, authors have analyzed the strategies of solving the social problems functioning in all 22 poviats of Małopolska (19 poviats and 3 cities with poviat rights). Preliminary analysis of the documents showed that such strategies were developed in all self government units, although some documents were developed after the deadline. The main reason for the above was the prolonged participatory character of the whole process. The carried out analyzes showed that the documents, despite the absence of repeated references corresponded with the strategic documents developed at higher levels – regional, national and international level. The analysis shows that the diagnostic part of the strategies is to a large extent elaborated. Its content fluctuates between 40% to almost 90% and covers an average of 76% of the document. The goals of the district strategies for solving social problems in Małopolska are different, as are the diagnoses presented in them. In the strategies there declared that the selection of priority areas was the result of an analysis of the current social situation of poviats, although most often elaborated on the basis of quantitative data, external environment analysis and statutory requirements.

In general, the issues in the strategies concerned: broadly understood support for families, particularly those at risk of exclusion, foster families, inadequate care and education; childcare; help the elderly and the disabled; promotion of employment; professional activation; and strengthening the cooperation of entities implementing social policies of poviats.

In 64% of the poviats, at the declarative level, there appeared the participation of representatives of public and non-governmental institutions. In the 30% of the poviats during the preparation of the strategy there were organized the workshops, where participated the representatives of the local government representatives, the representatives of the social welfare and labor market institutions, the representatives of the Police, the organizations of the third sector and possibly the social leaders.

Only 21% of the poviats declared co-creation of the strategy with the inhabitants. Only two of them indicated the form of consultation, which was the questionnaire delivered to residents through social assistance centers and non-governmental organizations. This polls were also posted on the website. It should also be noted that the share of inhabitants in the process of creating strategies more frequently appeared in newer strategies. As many as 77% of the strategies that indicated the participation of members of the community were developed after 2014. This fact would have a negative impact on the quality of the strategy, because the lack of contact with the inhabitants has in principle prevented the identification of new social problems and also increased the likelihood that the adopted
documents do not fully correspond to the actually existing needs, so the local government units will not be testified to suit the needs of residents of public services.

Participation of Italian citizens in shaping public services looks very different. Citizens only have an indirect influence on the creation of strategic documents in local governments, as exemplified by the strategic planning process described below in Piacenza.

The strategic planning process of the Italian local governments: the case of the province and the city of Piacenza

In 2011 the Italian Central Government passed a reform (Sicilia, Steccolini, 2017) on local governments. A new managerial tool was introduced: the unique document of planning (DUP in Italian) (Bleyen, 2017). Previously Italian local governments were used to produce many different documents aimed at planning and programming and linking the priorities with the budget. With the 2011 reform all the municipalities had to implement the same document with the same structure and the same aims. It is a 3 years document with a rolling process so each each a new period is added (2017–2019 document approved in 2016 becomes the 2018–2020 in 2017 and so on in the forthcoming years).

The DUP represents the framework and the linking pin with all the other managerial documents the Italian municipalities have to produce (e.g. budget, Performance plan) and it is strictly linked to the with the political agenda of the Mayor. In Italy before the election each candidate has to produce a document that represent the agenda for his/her government in case he/she should win the election. The DUP is made of two sections: the strategic and the operative parts. The strategic part presents the Key performance areas of the municipality for the next three years while the operative one address the implementation plans so to translate the strategy into actions. The DUP has to be approved by the city council yearly and it usually presents in its first part a SWOT analysis of the local government. The DUP and specifically the operative part represents the long term objectives and the priorities of the municipality and it is linked to two managerial tools the annual budget and the performance plan. The annual budget allocates the financial resources to the different actions for that specific year with the performance plan cascades the organizational objectives internally at unit and at personal level too.

In Italy all the public managers are given annual goals (financial and non financial goals) linked to the DUP and to the annual budget. If the individual targets are met financial incentives are given to the managers. Each single municipality has an independent body appointed for three years (renewable) in charge of measuring the individual and the overall performance of the organization (yearly production of a performance report).

Source: own study.
According with the Italian law all these documents have to be uploaded on the local municipality website. In this paper it will be analyzed the case of the City of Piacenza, a municipality of 102,000 inhabitants, place in the northern part of Italy and specifically in the EMILIA ROMAGNA Region. It is located by the Po river and it was founded by the Romans in the 3rd Century B.C.

The 2017–2019 DUP (the document aimed at managing the strategic planning process for the Italian municipalities) has been approved by the City Council on Sept 12th 2016. It is structured according with the 2011 law and divided in to parts: the strategic and the operative ones.

The strategic part presents a SWOT analysis of the City and strategic Goals. They are 11:

1. Economic Development for competitive City.
2. Innovation, research and university for a smart.
3. Health care, solidarity and social cohesion for a friendly city.
4. Environment for a sustainable city.
5. Mobility for a interconnected city.
7. Young generations and educational system for the city of the future.
8. Culture, tourism, free time and sport for educated city for the active city.
9. Protection and development of the territory for an attractive city.
10. Active citizenship and social inclusion for an engaged city.
11. Serving the communities for an efficient city.

Each of these strategic goals is then in detail described.

The last point of the strategic part is related to transparency and on the how the local government of Piacenza will report to the citizenship. The DUP clearly states that the social reporting will be twofold: annually with the discussion of the city council on the performance and right before the new election day with the final document produced by the administration in charge (strategic control). The operative part takes into consideration each single strategic objective describing how are in charge of implementing it, which are the involved stakeholders and which are the missions and the actions/programs to be implemented in the next three years. At the end of this part the DUP presents the budgeting system for the forthcoming years in term operating and capital expenditures and operating and capital revenues. This is aimed at linking the strategic goals, the strategic objectives and the action plans with the resources available and allocated. After having presented the content and the structure of the DUP, the new strategic planning tools implemented by the Municipality of Piacenza and for all the Italian local governments by the 2011 reform it is important to analyze the pros and cons of this managerial tool. As all the managerial tools it is neutral by definition it can be used in order to help managing the city or just in a bureaucratic way.

In term of transparency the documentation is uploaded on the city website (it is the law) but if the question is: will the citizens ever read it? The answer is no, it is a 301 pages long document, none will ever read it. It has internal purposes, managerial and political purposes, city managers and politicians are familiar with that document, the citizenship is not even aware of the existence of it; but it is available on the web. Each single municipality has its DUP posted on its website within the transparency folder. So the tool is there but the population is not engaged not aware and, perhaps not even able to understand that document. The average Italian citizen does not understand the different between a goal and an objective, and objective and a measure, a measure and its target. So from a managerial perspective this is way all these documents have to be approved by the city council and the discussion
Conclusions

From the above analysis it is clear that the influence of citizens on shaping public services in local governments in Poland and in Italy is clearly different. In Italy, the dominant form of governance is indirect democracy, otherwise called a representative, where citizens do not directly participate in the drafting of strategic documents, and their expectations are expressed primarily by voting in elections and through greater control of the authorities. In Poland over the last decade there has been an increase in public interest in public affairs. Communities see the need to co-decide on the quality and quantity of local public services and are more likely to be involved in the creation of strategic documents, although they are not always able to. It is therefore necessary to strengthen and regulate any direct forms of participation of citizens.

Finally, it is worth emphasizing that the study carried out by the Institute of Public Affairs shows that, from the point of view of participation in Poland, it is important that the services are universal and concern the general public and that they are selective and satisfy only specific needs, solve specific problems. It turns out that the type of services affects the level of participation (see Kaźmierczak, 2012). Using public services is not motivating for participation unless an initiative in this area comes from the service provider. Attendance in participation increases with individualization of services.

The pilot studies and conclusions drawn from them should be a contribution to their continuation. However, studies should be conducted with due diligence of statistical representativeness.

ABSTRACT
The article contains theoretical deliberations concerning the usage of crowdsourcing platforms in order to obtain creative resources necessary to design advertising services. The article also aims at defining what role crowdsourcing can play in the creative service market. The first part of the article presents the characterization of advertising as creative services and the role of crowdsourcing in gaining creative ideas. The concept of crowdsourcing platforms used as a way of gaining creative resources and creating ideas constituting the basis of the offered advertising services was presented in the form of examples in the next part of the article.

Introduction

Crowdsourcing as an effective concept of leveraging dispersed resources from a crowd has been used in various fields of activity. This also applies to advertising services performed by advertising agencies in the creative service market. Activities of advertising agencies are focused on providing buyers with creative ideas in order
to highlight their products and services in the market. The described situation creates the need for an advertising agency to obtain the access to creativity resources and is a major challenge for its business tasks.

The aim of the article is to indicate the development potential of advertising services using crowdsourcing, as well as to characterize entities applying the indicated concept in business practice.

The paper uses the methods of literature review, analysis of exemplary crowdsourcing platforms and synthesis.

The role of crowdsourcing in the creative service market

Advertising services belong to the creative service sector and are offered by companies that derive income from the sale of their time and transfer of the rights to their intellectual property to other businesses or organizations. Advertising services, being creative services, are characterized by the following set of attributes:

- a significant importance of creativity in the creation of advertising service core,
- an innovative work conceived as a result of a creative specialist’s work,
- no possibility to objectify the performed activities and effects of service process related to them,
- the competencies of professionals are based primarily on unique abilities and gathered experience.

Entities performing advertising services are required to possess specific competencies in the scope of creation and performance of creative ideas in various areas of promotion and image-building activities. According to the American Association of Advertising Agencies, advertising agencies that act as entities offering creative services are independent organizations gathering creative and entrepreneurial people who specialize in preparation and realization of promotional plans and tools (Wiktor, 2001). Entities operating in the advertising service market can be distinguished from others by:

- the scope of the service offered and the degree of specialization,
- type of customer serviced,
- the organization’s structure and number of employees.

Therefore, for many years the creative service market has been characteristically divided between global advertising companies whose clients are international brands, and smaller, specialized local advertising agencies. Global advertising companies have in their organizational structures departments responsible for delivering creative ideas and solutions. Apart from the employed specialists, creative departments may if needed, benefit from the work of independent designers. Moreover, cooperation is underpinned by outsourcing, while the individual designers create, among others, graphic designs, advertising messages, name, and corporate logos based on precisely defined expectations. The scope of works depends primarily on advertising activity. However, it should be noted that the number of designers cooperating with an agency is usually limited and that competencies are strictly defined and verified. The added value offered by global advertising agencies is enriching the core of an advertising service with additional services, such as advising on the selection of marketing strategies, market research, including preliminary tests of developed projects, and supervision of the implementation of developed ideas. The extensive offer of additional services allows such agencies to keep attractive brands in an order portfolio.

In case of the latter group, i.e. small local agencies, it is expensive to maintain a bigger group of designers responsible for creative ideas in organizational structures. The main reason for this is a limited access to big advertising budgets that make it is possible to maintain creative specialists. Although such entities often benefit from the work of independent designers, their cooperation is threatened by poor quality of the offered ideas. Advertising agencies in the described group less often add additional services to the creative core and, in turn, focus only on
providing ideas. Usually their offer is limited to graphic designs, preparation of advertising texts, or the basis of visual identification systems.

Limitations of both types of advertising agencies are related first and foremost to the crucial resource that, in described services, is creativity. A characteristic feature of this resource is that it is not related to a particular profession, education, or place of residence. Creativity is dispersed in the crowd and its acquisition requires creation of a favourable co-operation between the parties: the designer and the contractor of the creative service.

The answer to the above-mentioned challenge is crowdsourcing. Following the definitions of J. Howa (2006) G. Kazai (2011) and M. Poetz (Poetz, Schreier, 2012), crowdsourcing can be described as an enterprise’s or institution’s activity leading to acquisition of dispersed resources belonging to heterogeneous crowd by means of online public inquiry. Such resources may be information, knowledge, experience, ideas, skills, free time, work, or financial resources.

One of the key resources for crowdsourcing is creativity, understood here as an ability to solve problems and create ideas for a new product, graphic design, logo, advertising message, etc. In principle, crowdsourcing provides more creative ideas than other traditional and previously applied methods. This concept allows organizations to access a rare type of resource, which is creativity of dispersed creators, whose ideas, skills, and remarks have been so far undervalued and unused (Brabham, 2008). The examples analysed in the literature suggest that a large amount of ideas and hidden knowledge allow organizations to discover new patterns and trends that are important from the point of view of a potential recipient (Howe, 2008). The use of crowdsourcing has a positive effect on the efficiency and speed of generating ideas. The combination of the number of participants, creativity and passion, provides many interesting ideas quickly. Consequently, the short time spent on creating new ideas has a significant impact on the business process efficiency.

The use of crowdsourcing however, requires fulfilment of specific conditions (Howe, 2008):
1. Properly defined crowd characteristics. Depending on the resource that is planned to be acquired and the complexity of the ordered task, both the size and the characteristics of the crowd may vary.
2. A precisely described task, which is the basis for the execution of the order by the crowd.
3. Well-chosen tools and technologies for a two-way flow of information.
4. Preparation and selection of a public inquiry form.
5. Preparation of a remuneration system for completed and accepted tasks.

Implementation of crowdsourcing requires from an enterprise to not only prepare proper conditions described above, but also to be more open and go beyond the patterns existing in the organization.

Crowdsourcing is currently being intensively developed in the following areas (Petavy, 2017):
1. Innovation: product, service, experience or business model innovation.
2. Marketing & communications: Brand strategy (naming, identity), communications (positioning, communications platforms, creative development), Activation and promotions.
3. Design: Design (packaging, point of sale, retail).

Research carried out in 2016 showed that the ideas derived from the crowd by means of crowdsourcing were implemented in (Petavy, 2017):
- 59% in the area of innovations,
- 34% in the area of marketing-communication activities,
- 7% in the area of design.
The use of crowdsourcing platforms on advertising service market

Crowdsourcing platforms that are tailored to the purpose of business activity and character of acquired resources are employed in business (Galizia, Garibaldi, 2014). Using crowdsourcing platforms to acquire and offer creative ideas for advertising products is becoming more and more common. Examples of this type of phenomenon are crowdsourcing platforms that have been operating for over a decade, described below as creative agencies.

Crowdsourcing platform is a business model that enables the acquisition of distributed resources from the crowd for a specific purpose and in a specific business area. In case of advertising services, for which creativity is a key resource when using these platforms, special attention should be paid to the following elements.

The type and characteristics of crowd. When talking about creative services offered by crowdsourcing platforms, it is essential to provide the customer with the best ideas for graphic design or advertising text. Making use of a crowd of creative designers allows platforms to deliver a greater number of ideas that are more diverse. This is possible thanks to the applied rule saying that creativity may come from anyone, regardless of education, profession, or geographic location. Such approach creates a society of passionate people who eagerly share their creativity and can create interesting projects. Of great importance is also the fact that projects are created in parallel and that their creators have no contact with each other. This increases the chances of creating many independent, varied proposals for the client.

Well-defined objective. The concept of engaging crowd in action requires a person ordering to precisely define the task. In case of creative services related to creating graphic ideas, it is necessary to develop a proper description of the task.

Specified way to invite the crowd to cooperate. In case of the discussed services, contests constitute a form of a public inquiry. Participation in a contest is voluntary and does not guarantee a gratification. Creators decide themselves if they want to take part in the ordered task based on its description.

Well-chosen technologies. Works implemented on crowdsourcing platforms require properly selected technical solutions. The choice of technology affects communication efficiency and security of transactions.

Legal procedures. Given the character of the conducted services, preparation of legal procedures that facilitate management of intellectual property and acquisition of projects also becomes of particular importance. Crowdsourcing platforms implement the principle of confidentiality using the following solutions:
- contestants sign confidentiality agreements,
- use of market ideas requires signing an agreement on transfer of copyrights.

Remuneration for specific and sold projects. In case of crowdsourcing platforms that offer creative services, an important gratification is payment for the winning project. Remuneration usually falls into the range of 1,000 to €10,000 divided among the best designers (Petavy, 2017). Apart from the financial incentives, the possibility to present one’s works created on the platform and outside it to potential buyers is equally important.

The above-mentioned requirements are only the basis for the creation of models of crowdsourcing platforms operating in the creative service sector. Nevertheless, it should be noted that what distinguishes crowdsourcing platforms operating in the described way is the great number of acquired ideas and short time of project completion. Crowdsourcing platforms chosen for exemplification have been designed on the basis of independent rankings.

</table>

Based on the crowdsourcing platforms presented in the above table two different business models can be distinguished. In the first model, implemented by e.g. CrowdSPRING, 99design, Designhill, and Tongal, the crowdsourcing platform manages the entire creative process, from gaining ideas to realizing them. A great advantage of this type of platforms is, first and foremost, creative resources of designers who number around 1.5 million in case of 99design, and several hundred thousand participants in case of the other described platforms. Access to creative potential is possible only from the platform, which, in this case, is an active intermediary between the parties. Similarities between the described platforms from the point of ordering party are presented below:

- scope of offered services,
- degree of legal protection,
- guarantee of satisfaction with the purchased creative projects,
- short order execution time,
- specified price for the offered services-packages,
- communication between the ordering party and the designer takes place only through tools shared on the platform.

Similarities between the functioning of platforms from the perspective of the service provider (the designer) are mainly:

- designers’ participation in the project is based on the idea of a competition,
- gratification is determined before the task begins,
- protection of intellectual property is clearly defined and specified,
- portfolios and profiles of designers are available on the platform,
- completed projects are also available on the platform.

The differences in the activities of the analysed platforms are not as prominent as the aforementioned similarities. It is possible to find features that, at a marketing level, distinguish the offer. For example, the crowdsourcing platform CrowdSPRING links the price of the package to the level of security and confidentiality of the obtained and transferred information. Thus, it points out the essence of legal protection of the prepared projects. The largest platform, 99designs, links the price to the number and quality of designers, additionally emphasizing the speed of execution and staying within the determined budget. This is a big advantage when compared to traditional advertising agencies that rarely assure meeting the determined budget at the stage of offer. Another platform, one
that has been operating on the market for the shortest span of time, Designhill, is characterized by great efficiency and low prices. Its packages are mainly limited in regards to the number of designers.

In the case of the first described cooperation model, the buyers, i.e. the representatives of small and medium-size companies, gain access to a vast number of interesting and diverse advertising projects that are executed in a short time. Another advantage of these types of platforms is the guaranteed fixed price of the order execution. The number of accomplished projects with the participation of a multitude of designers enabled the analysed entities to achieve profits significantly higher than local agencies. The prices of services offered by crowdsourcing platforms are usually included in packages with a value between USD 100 and USD 1,000. As to the benefits of the designers, the main advantage is the access to a market of potential buyers located in different regions of the world. Moreover, it is the prepared project proposal and not the designer’s competence that goes through assessment. The downside of the aforementioned model is mostly the lack of professional advice at the stage of project selection. The buyers must decide on their own, which, together with the lack of experience and knowledge, may result in a wrong choice.

Another model of cooperation is the so-called community model (Petavy, 2017). An example of use of this model is the crowdsourcing web platform eYecka. Community models:

- allow access to a highly motivated creative community,
- provide the tools and IT technologies to facilitate the flow of information,
- organize and control the course of competitions, and select projects,
- develop financial and legal frames for cooperation.

eYecka platform, unlike the model mentioned before, offers its customers advice and support at various stages of cooperation with creators. Both buyers and creators are moderated by the platform staff in order to achieve the best final results. Inquiries from buyers are discussed in detail and refined before being submitted to execution. Projects submitted by creators undergo internal pre-selection and evaluation by eYecka employees. This platform has a developed system of cooperation, evaluation, and selection of projects submitted by thousands of designers and members of a creative crowd.

Both models of crowdsourcing platforms provide a perfect solution for an effective acquisition of creative ideas. The number of implemented ideas, creators involved, as well as the short project execution time, make these solutions a viable opportunity for the development of the creative service sector.

Conclusion

The concept of crowdsourcing applied in the creative service sector provides an unprecedented access to creativity dispersed in a crowd. Creativity, as the core of the advertising service, has been freed from the organizational constraints of a company and has become its authentic resource. Utilizing this potential becomes not only a great opportunity, but also a challenge for the advertising agencies as entities in the creative service market. Regardless of size and location, advertising agencies can use crowdsourcing to provide their customers with new, creative ideas for advertising actions in a shorter time and at a lower cost. This kind of approach facilitates access to high quality advertising products for a bigger group of small and medium-size companies as buyers, which has a positive impact on new operating conditions of entities. The creators themselves have become more important, as their work, until recently merely a hobby or additional activity, has become a valuable resource.

Advertising agencies that use crowdsourcing may apply different models of action. In business practice, both the integrated model, such as crowdsourcing platforms that offer a standardized offer for creative services, and
the hybrid model, exemplified by community platforms, are applicable and effective. The hybrid model can be an incentive to move beyond the rigid framework of division between local and global agencies for entities operating so far in the traditional way in the advertising market. Hybrid agencies combine the strategic knowledge of their employees with the external resources of creative communities. In this arrangement, the employees of the agency remain in their role of the designers’ work coordinators. The only difference is that they have access to unlimited creative ideas resources, which highly increases the chance to meet the needs of demanding customers.

In the context above, crowdsourcing becomes a solution to overcome the existing limitations in the creative service sector. This particularly applies to improvement of quality in case of creation of unique ideas. As indicated by the conducted research, this is the most desired feature of any good advertising service.
